NET/Mono virtual machine and Microsoft.NET runtimes, debugger, and project settings. .NET/Mono and Visual Studio 2010 support integration with OpenGL and DirectX for optimizing the application. As of 2011, Code Composer Studio is available in both 32-bit and 64-bit versions. In the 64-bit version, code can be produced for 32 and 64-bit Windows OSs. Technology Code Composer Studio uses Microsoft's.NET, which provides common programming tasks including process and thread management, garbage collection, and object-oriented programming. The.NET Framework supports integration with OpenGL and DirectX for optimizing applications. Code Composer Studio's version of OpenGL is integrated with the.NET Framework 4.0. Direct3D is not supported. Object-oriented programming is supported with the use of Code Composer Studio's integrated C++ compiler. Interfaces to software libraries and hardware devices, such as an embedded system's UART, CAN bus, SPI, I2C, and SPI devices, can be added using the Code Composer Studio language extension. Users can write software in a language or language-like dialect, such as Assembly, C/C++, C#, Java, and Visual Basic.NET, and then create new projects based on an existing project template. Embedded features Core library Code Composer Studio includes a set of embedded libraries: Input Library – contains an event management subsystem Logging Library – provides logging framework Media Library – contains a media-handling subsystem Network Library – provides connectivity framework Object Manager – provides a cross-platform core object management subsystem Linux version The CCS Linux version can be used on any Linux system running Ubuntu 12.04 or later. It is designed to run on a Linux system as a normal program and to interact with the Linux kernel. In 2007, Embedded Studio ported the Code Composer Studio debugger to run on Linux using the GDB debugger. The Code Composer Studio Linux distribution comes with the following applications pre-configured for use on Linux systems: CCS Linux – an embedded C/C++/assembly development system, including a Linux-based debugger and text editor Real-time C/C++ profiler Memory profiler CCS Linux Shell – a Linux-based command-line shell, providing commands to start processes and retrieve process results A copy of Code 82157476af
